

How it Works

The Rinse Pimp is an innovative and practical spot-free rinse system that prevents spots, streaks and filmy residue. The Rinse Pimp also prevents potential damage to paintwork that can be caused by hand drying (dirt particles on the chamois or towel can be abrasive). The Rinse Pimp uses ion exchange technology. Ion exchange is one of the most effective water filtration methods available. The Rinse Pimp removes unwanted minerals and other impurities in the water which cause the marks usually left after rinsing with unfiltered water. The water passes through a non-hazardous plastic resin leaving behind the unwanted impurities and then exiting the Rinse Pimp as pure filtered water.

The resin becomes exhausted after a certain amount of impurities have been deposited and when this happens the TDS reading will be in excess of 20ppm. The resin will still continue to filter the water and you can achieve relatively spot free results between 20ppm and 50ppm but the water quality will quickly deteriorate after it reaches 20ppm. The Rinse Pimp unlike some other alternatives is refillable so when the resin becomes exhausted you simply order replacement resin from us and change it. The ability to refill the Rinse Pimp makes it more environmentally friendly and more economical, saving you money.

The life of the Rinse Pimp before a resin change is necessary depends on how hard the water is in your area for more information please see the UK water hardness and the predicted resin life pages on our website.
